

Spray particle deposition study in Wisconsin

Investigations of spray particle deposition at upwind, inswath and downwind. ANOVA was performed for spray particle deposition at upwind and inswath, and a Linear Model was used to predict pray particle deposition with distance at downwind. Hooded sprayer makes a bigger difference on spray particle deposition, followed by nozzle and drift reduction agent.

Deposition upwind

Deposition inswath

Intercept at downwind

Slope at downwind

Area under the curve at downwind

Predicted downwind distance (m)
